### Project Description

Our website is geared towards people between the age of 50 and 65 who are looking to learn more about the technology they encounter in their daily lives. Our goal is to present users with tutorials that explain simple technology uses in concise articles and guides. Similar sites to ours would be WikiHow and W3Schools but our site would focus on the day-to-day uses of technology that might not be apparent to most people. These guides will be focused on educated people in our age range, but the topics could be useful to anyone of any age.

### Possible benefits of the project

This site could help users feel more confident with their devices and lower the need to ask others for help. This could help mediate embarrassment that a user might feel by asking for help and make the users more confident in their technology purchases.

### Current/similar Solutions

- Sites similar to ours would be WikiHow, W3Schools, Senior Planet, Skillful Senior, and SeniorNet.
- Our site would vary from a lot of these because we aren't offering full on courses like they do, we would just focus on simple guides and tutorials. It would also differ

from sites like WikiHow because the content wouldn't be user-generated, it would be curated and written by us and focus purely on tech and its uses.

**Estimated duration of the project:** about 4 months

### **UI/UX and User-Centric aspects of the project**

List the things you will do to make the site user-centric and UX compliant.

1. Avoid overcrowding pages with information
2. Have clear labels for buttons and links
3. Have clear routes between pages no matter which one the user is currently on
4. Have responsive buttons that make it clear when they have been clicked
